

UNIVERSITY OF LEEDS

The Crime Drop:

Hypothesis-Based Quant

Graham Farrell

26 Oct 2016

Overview

- ▶ Basic quants
- ▶ Trends, bits 'n pieces
- ▶ Data signatures
- ▶ Drawing conclusions

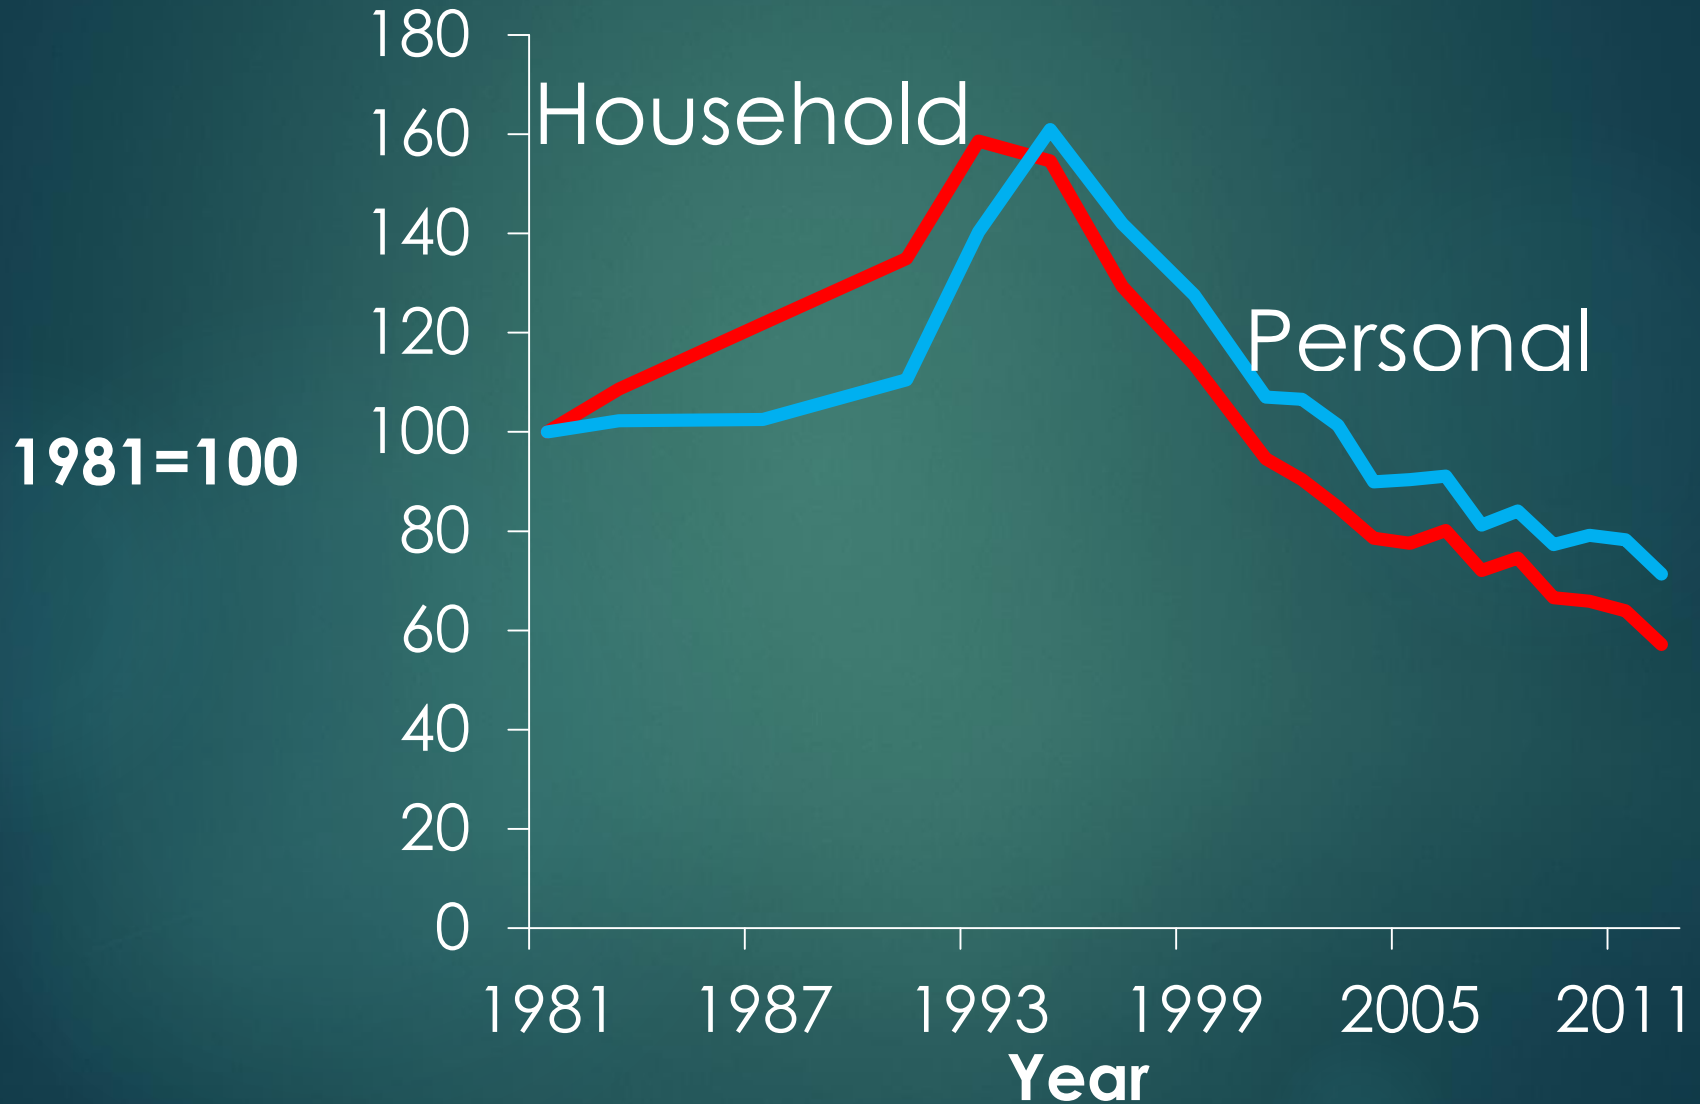

England and Wales

(CSEW)

England and Wales

(CSEW)

United States 1976-2012

(NCVS)

1976=100

United States 1960-2012

(UCR)

International crime drop – not a coincidence

- ▶ United Kingdom
- ▶ United States
- ▶ Canada
- ▶ New Zealand
- ▶ Australia
- ▶ Netherlands
- ▶ France
- ▶ Rest of Europe

The Security Hypothesis

Crime fell due to

- ▶ Security improvements widely implemented
 - ▶ 'Avalanche of security'
- ▶ These produce ***data signatures*** consistent with how they reduce crime
- ▶ With a *diffusion of benefits*; and without displacement

Clarke's Avalanche of Security

- ▶ So many types of security in all areas of public and private life
- ▶ Entertainment districts
- ▶ Housing
- ▶ Transportation
- ▶ Businesses
- ▶ Retail

Car Crime

Vehicle crime

(CSEW)

The story of car crime

From mid-1980s – high security door deadlocks, then electronic immobilisers

Gradual spread

high risk popular cars first

e-immobilisers not mandated on new until 1998

Produced stages of crime decline and continued improvement

Car theft peak

How easy
was that?

“The tool that was usually carried was a screwdriver ... used to open a car door by inserting it into the car lock and twisting . . . ‘Quicker than a key’ according to one of the offenders, aged 17 . . . Fords and Vauxhalls were most popular because they were ‘easier to get into and get away’ . . . All stated that they were not just after any car, but sporty fast cars.

(Spencer 1992, p.15)

▶ A few popular models accounted for a disproportionate amount of car crime

- ▶ “...manufacturers ... made improvements to the security of popular models” (Houghton 1992)
- ▶ “... the Escort Mk3 introduced security improvements in 1986.” (Houghton 1992; 12)

- ▶ Ford Escort Mark III was 50% more popular than any other car on the road

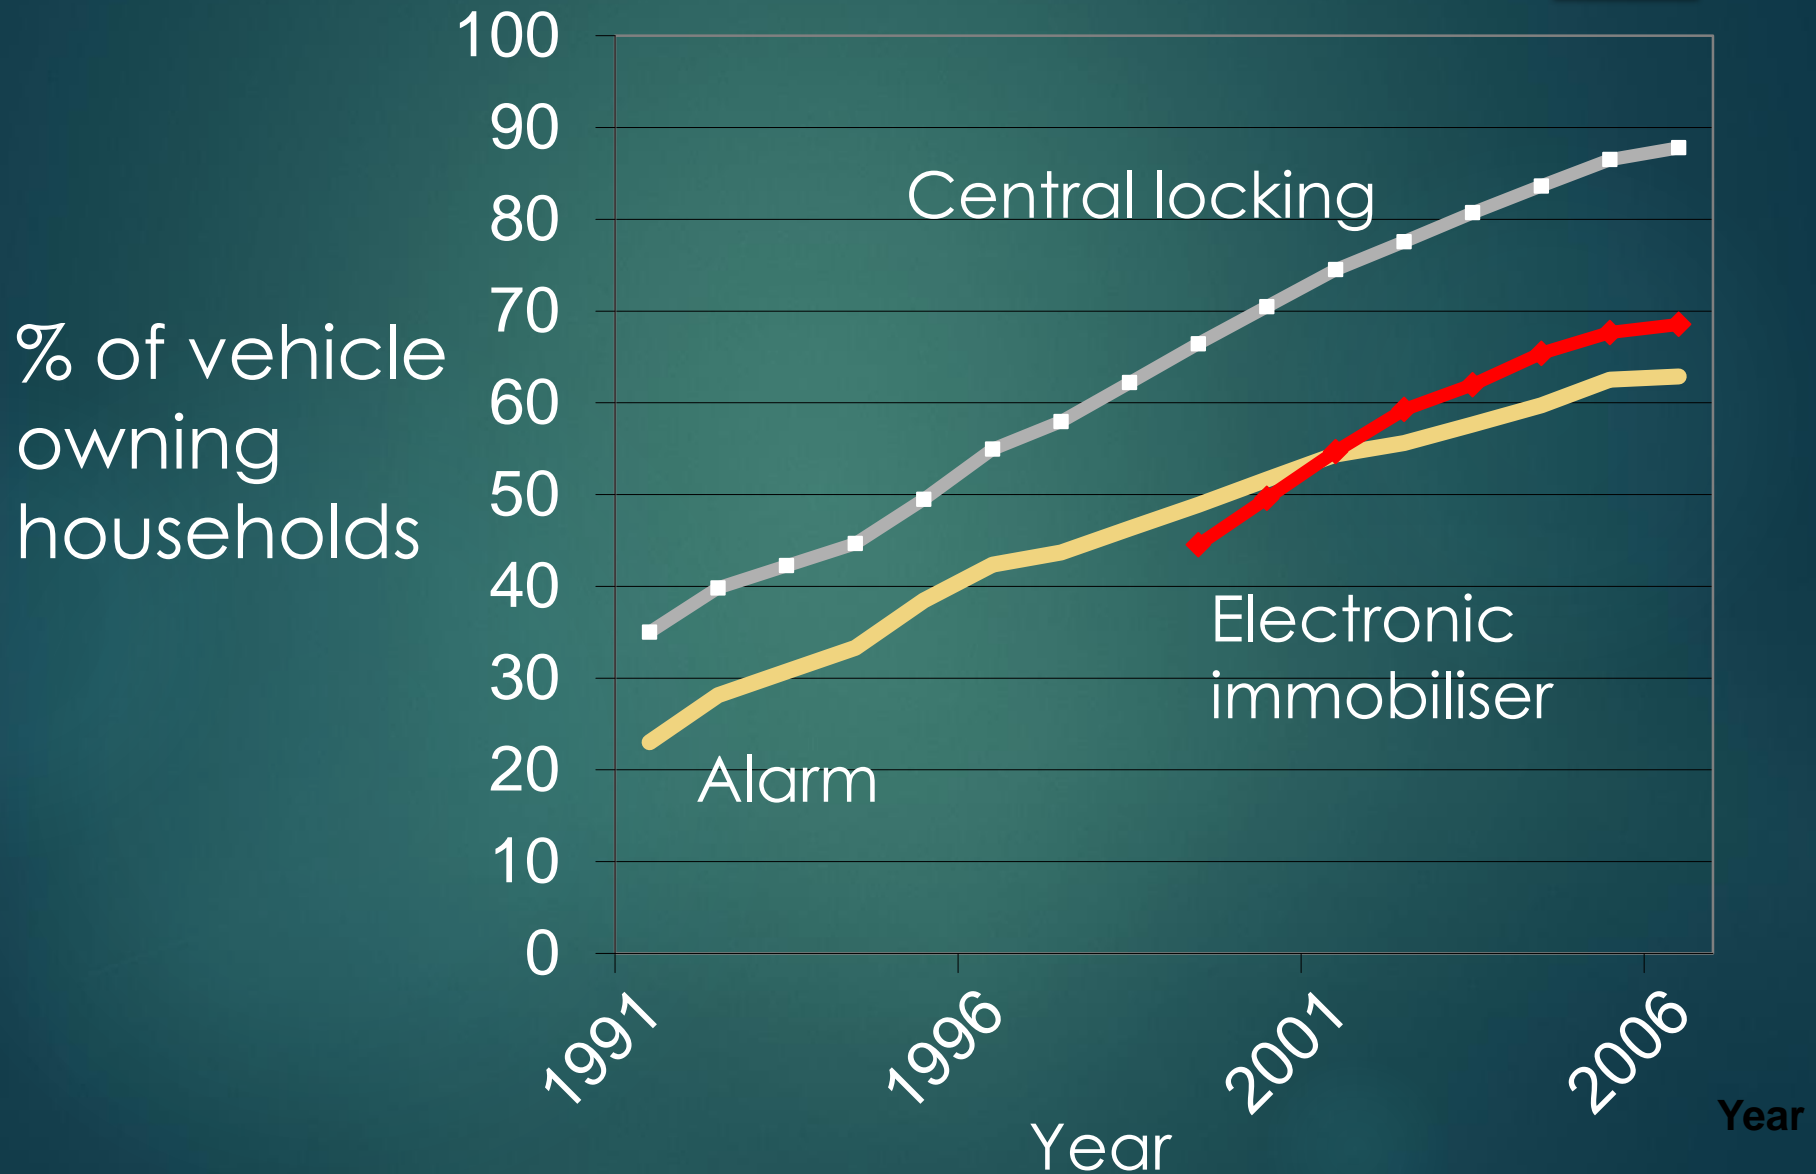

- ▶ With security, Escort Mk III thefts fell 65% by 1990

- ▶ Model this

Car security levels

Source: CSEW

Joyriding fell more

Source: CSEW

Model Condition 3
Scale=0.2 Gradual=FALSE low=1998
Average Error= 4886.57575757576

Data signatures

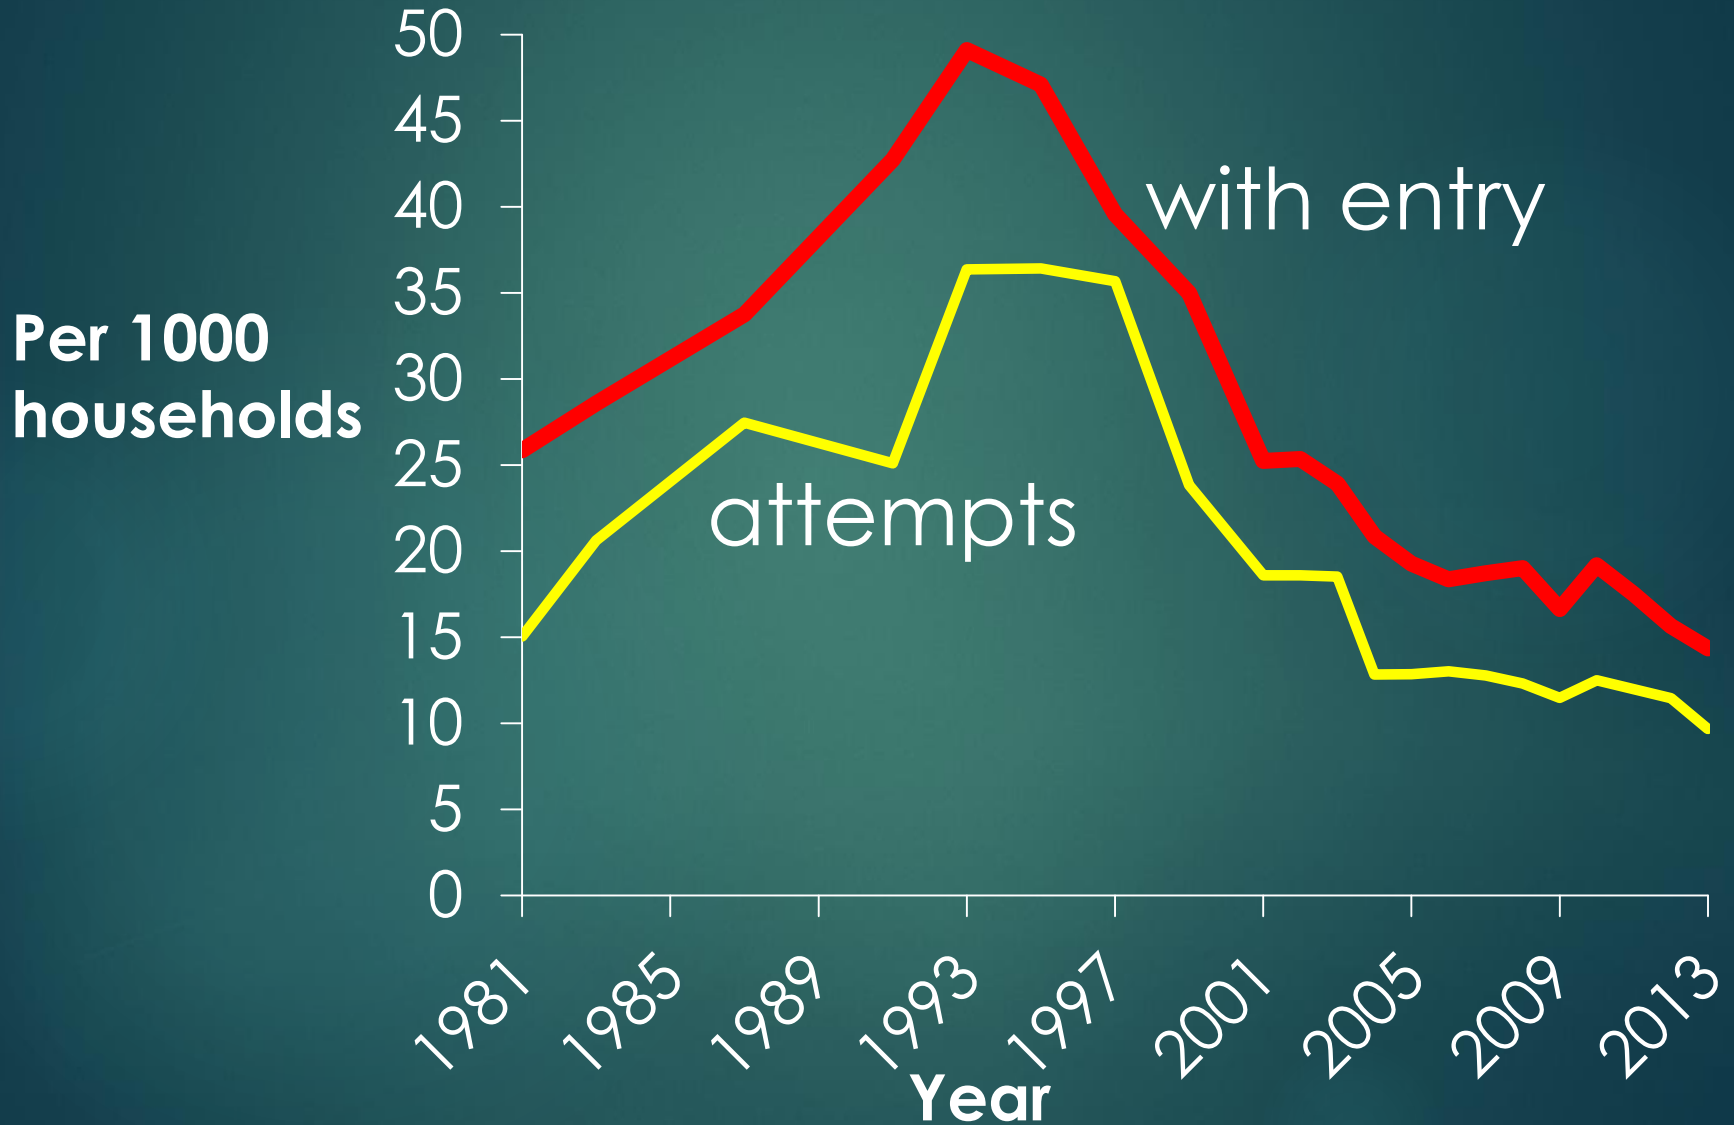

- ▶ Timing – spread of security
- ▶ Initial focus – popular high risk vehicles first
- ▶ Joyriding fell more
- ▶ Door forcing fell
- ▶ Security device quality
- ▶ Device combinations
- ▶ Stolen cars became older
- ▶ Agent based simulation model

- ▶ Natural experiments in Australia and Canada

- ▶ Similar findings for Australia, Germany, Netherlands, United States

Burglary

Burglary

The story of burglary

- ▶ Decline in households without security
- ▶ Rapid rise in use of multiple security devices
- ▶ Causing forced entry to decline
- ▶ Via spread of double-glazing and home improvements (AC in US)

Effective security combinations

Means of entry

▶ Forced

- ▶ Remove or break window or door frame, panel or glass – security overcome

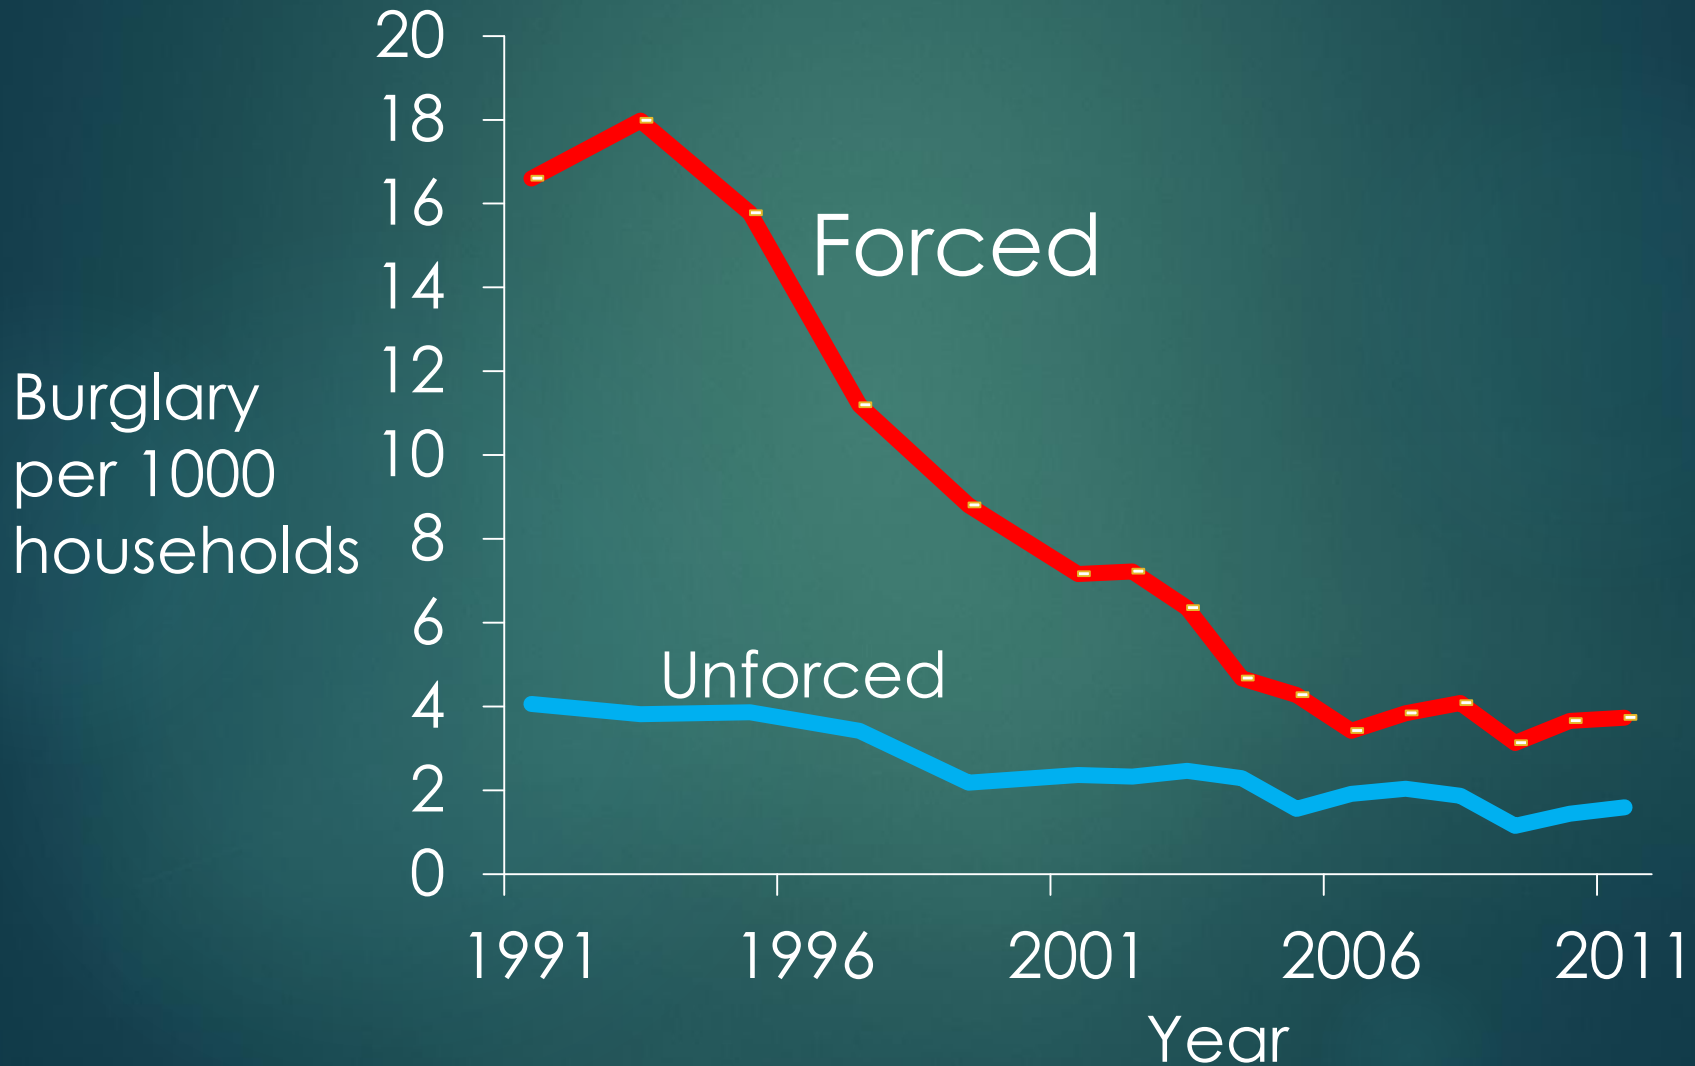

▶ Unforced

- ▶ Use key; push past; deception – no security overcome

Doors

Windows

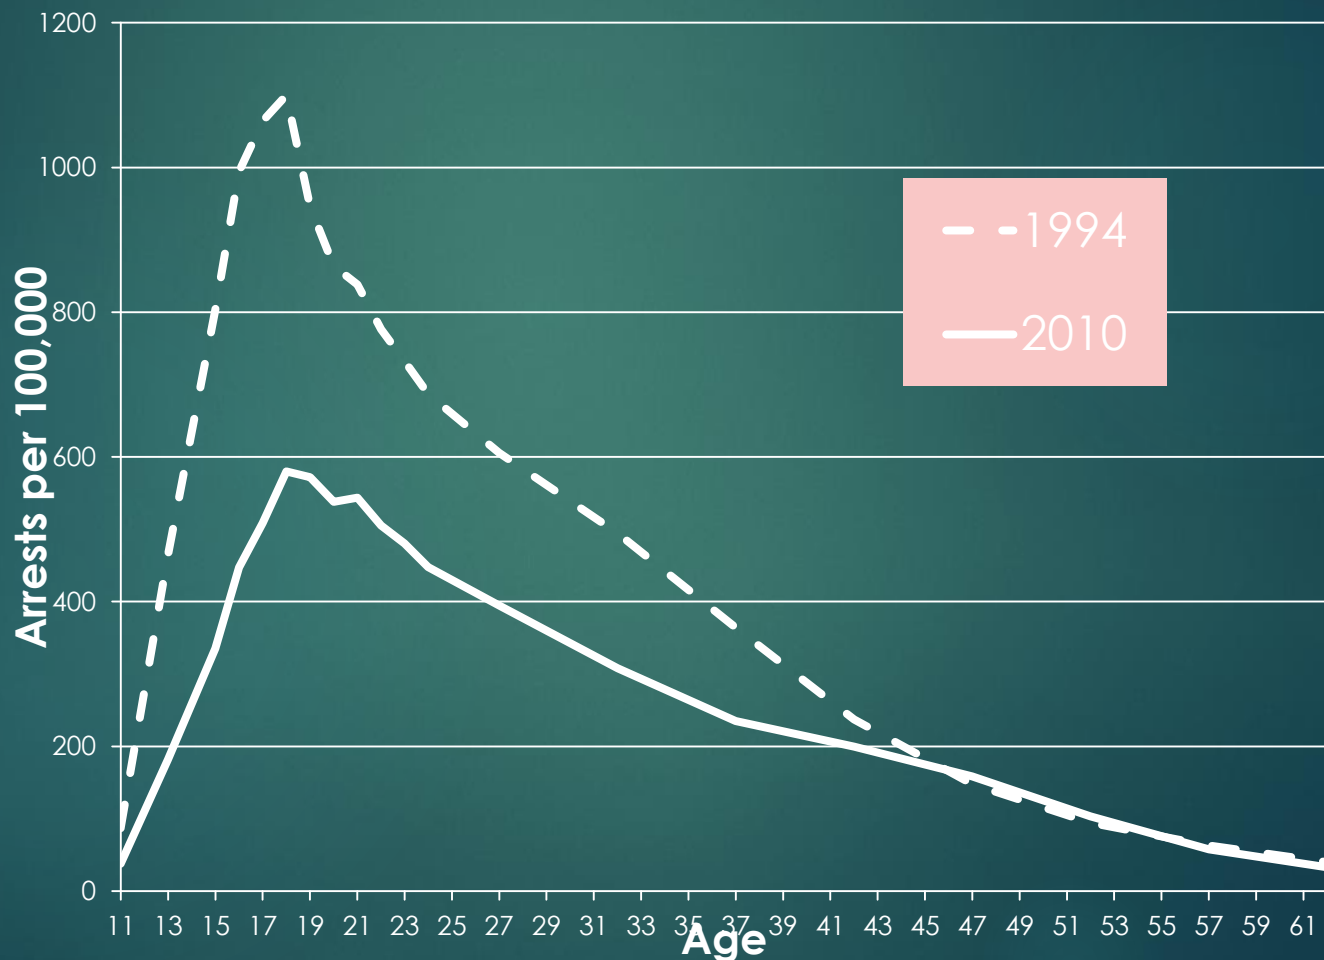

Age and crime and security

NEARLY DONE! NEARLY DONE!

Violent crime drop: young offenders

Age-specific arrest rates (United States; BJS)

CONCLUSION

Quant data signatures

- ▶ Basic analysis
- ▶ Triangulation from different crimes, times, places, and analytic angles
- ▶ What's its statistical significance?

Substantive

- ▶ Most crime 'rational', preventable
- ▶ Most criminological theory largely irrelevant
- ▶ Policy – security
 - ▶ prevent cyber-crime, e-fraud, ID-theft, terrorism, emerging crimes
- ▶ This is evidence-based problem-solving crime science

Thank you for
listening
